

# Graph Representations

**Dr. Mattox Beckman**

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN  
DEPARTMENT OF COMPUTER SCIENCE

Spring 2024

# Objectives

- ▶ Use three methods of representing a graph
  - ▶ Adjacency Matrix
  - ▶ Adjacency List
  - ▶ Edge List
- ▶ Explain the time complexities and tradeoffs

# Graph Properties

# Directed Graphs

## Directed Graph

## Adjacency Matrix

	1	2	3	4	5	6
1				8		
2			7	6		
3					1	9
4					5	3
5						
6						

# Undirected Graphs

## Undirected Graph

## Adjacency Matrix

	1	2	3	4	5	6
1				8		
2			7	6		
3		7			1	9
4	8	6			5	3
5			1	5		
6			9	3		

# Unweighted Graphs

## Unweighted Graph

## Adjacency Matrix

	1	2	3	4	5	6
1				1		
2			1	1		
3		1			1	1
4	1	1			1	1
5			1	1		
6			1	1		

## Adjacency Matrix Implementation

```
1  typedef vector<int> vi;
2  typedef vector<vi> vvi;
3
4  cin >> N; // number of nodes
5  cin >> E; // number of edges
6
7  vvi graph = vvi(N,vi(N));
8  for(int i=0; i<E; ++i) {
9      cin >> s >> d >> w ; // source, destination, weight
10     graph[s][d] = w;
11     // and if undirected, do this too
12     graph[d][s] = w;
13 }
```

- ▶  $\mathcal{O}(n^2)$  memory — expensive!
- ▶ What kind of queries are good for this?

# Directed Graphs

## Directed Graph

## Adjacency List

1	(4,8)	
2	(4,6)	(3,7)
3	(5,1)	(6,9)
4	(6,3)	(5,5)
5		
6		

# Undirected Graphs

## Undirected Graph

## Adjacency List

1	(4,8)			
2	(4,6)	(3,7)		
3	(5,1)	(2,7)	(6,9)	
4	(6,3)	(5,5)	(1,8)	(2,6)
5	(3,1)	(4,5)		
6	(3,9)	(4,3)		

# Unweighted Graphs

## Unweighted Graph

## Adjacency List

```
1 4
2 4 3
3 5 2 6
4 6 5 1 2
5 3 4
6 3 4
```

## Adjacency List Implementation

```
1  typedef pair<int,int> ii;
2  typedef vector<ii> vii;
3
4  cin >> N; // number of nodes
5  cin >> E; // number of edges
6
7  vii graph = vii(N);
8  for(int i=0; i<E; ++i) {
9      cin >> s >> d >> w ; // source, destination, weight
10     graph[s].push_back(ii(d,w));
11     // and if undirected, do this too
12     graph[d].push_back(ii(s,w));
13 }
14
15 // accessing edges of node a:
16 for(auto it=graph[a].begin(); it != graph[a].end(); ++it)
17     cout << a << " goes to " << it->first() << " with weight "
```

# Directed Graph

## Directed Graph

## Edge List

(1,4,8)  
(2,4,6)  
(2,3,7)  
(3,5,1)  
(3,6,9)  
(4,5,5)  
(4,6,3)  
(5,6,1)

# Undirected graph

## Undirected Graph

## Edge List

(1,4,8)

(2,4,6)

(3,5,1)

(4,6,3)

(2,3,7)

(3,6,9)

(4,5,5)

(4,1,8)

(4,2,6)

(5,3,1)

(6,4,3)

# Unweighted Graph

## Edge List

### Unweighted Graph

(1,4)

(2,4)

(3,5)

(4,6)

(2,3)

(3,6)

(4,5)

(4,1)

(4,2)

(5,3)

(6,4)

(3,2)

(6,3)

(5,4)

## Edge List Implementation

```
1  typedef pair<int,int> ii;
2  typedef pair<ii,int> edge;
3  typedef vector<edge> vedge;
4
5  cin >> N; // number of nodes
6  cin >> E; // number of edges
7
8  vedge graph;
9  for(int i=0; i<E; ++i) {
10     cin >> s >> d >> w ; // source, destination, weight
11     graph.push_back(edge(ii(s,d),w));
12     // and if undirected, do this too
13     graph.push_back(edge(ii(d,s),w));
14 }
```

- ▶  $\mathcal{O}(e)$  memory — Not bad!
- ▶ What kind of queries are good for this?
